

Who approves what, and who we have to appoint

One offering's route from intake form to published entry. Every box is a status in the system; its colour is who the record is waiting on while it sits there. This note exists to settle one question before go-live: how many reviewers, approvers and publishers do we need, and who are they?

DOCUMENT	DATE	STATUS	APPLIES TO
Approval flow v1.0	16 September 2026	For business decision	SolutionsHub Phase 1

01 The approval flow

Solid arrows move the record forward; dashed arrows are the ways it comes back. Site Admin is deliberately absent – it is not a stage in the flow: an Admin grants every other role, maintains the Business Group and capability lists, and can perform any transition as a safety valve when someone is on leave.

02 The five parts to play

Only three of these are assignments an Admin has to make. The other two come free — one with signing in, the other with being named on a record.

SUBMITTER & OWNER

Anyone who can sign in may submit. Offering Owners, co-leads and solution architects are named on the record itself and get edit rights to that one record.

No assignment needed

REVIEWER

Claims a new submission, works with the owners on the content, sends it back for updates, and marks the review complete. Can be scoped to one or more Business Groups.

1-2 per Business Group

APPROVER

The approval decision: approve, send back for changes, or reject with a reason. Approving writes an immutable snapshot of the record. Can be scoped to one or more Business Groups.

2 per Business Group

PUBLISHER

Works the readiness checklist, selects the destination, downloads the export package, and records where and when the offering went live. One pool for the whole site.

1-2 in total

SITE ADMIN

Grants and revokes every other role, maintains Business Groups, capabilities and publishing destinations, archives or reopens records, exports the audit log.

2 in total — keep it small

03 The two rules that drive the headcount

1. Nobody **completes the review** on an offering they are named on.
2. Nobody **approves** an offering they are named on — Site Admins included.

Both are enforced in code, not by convention. So a Business Group whose approver is also its most active offering owner will deadlock the first time they submit something: that is why the approver column in the worksheet wants two names, not one. If the business would rather run a single central pool, leave the Business Group scope empty and those reviewers and approvers see everything — scoping can be added later without a code change.

04 Every step, and what the system checks first

The right-hand column is enforced server-side on every request. Hiding a button in the interface is a convenience, not the control.

STEP	WHO CAN DO IT	BLOCKED UNLESS
Submit	ANY SIGNED-IN USER	All required fields are filled, 1–3 capabilities chosen, at least one Offering Owner named, and at least one supporting file or resource link attached.
Claim for review	REVIEWER in scope	The record is <i>Submitted</i> .
Request updates	REVIEWER APPROVER	They have written what needs to change.
Resubmit	RECORDER, OWNERS, CO-LEADS	The record passes the same completeness check as a first submission.
Mark review complete	REVIEWER in scope	The record is complete and no blocking comment is unresolved – and the reviewer is not named on the record.
Approve or reject	APPROVER in scope	They are not the recorder, owner or co-lead of that record. A rejection needs a written reason.
Confirm ready to publish	PUBLISHER	A publishing destination has been selected.
Record publication	PUBLISHER	The published URL has been entered. The six-month review clock starts here.
Confirm still current	OWNERS AND CO-LEADS	The record is <i>Published</i> .

05 Worksheet – the names we still need

The Business Groups below are the placeholders currently seeded. The definitive list is the business's to confirm, and is editable in Admin without a release.

BUSINESS GROUP	REVIEWER(S)	APPROVER(S) – TWO, IDEALLY
Digital Solutions		
Global Engineering Solutions		
Corporate / Enterprise Functions		
Unscoped – sees everything		

SITE-WIDE ROLE	PEOPLE
Publisher	
Site Admin	

Drawn from the behaviour already built in the Phase 1 application – `app/workflow.py` and `app/policy.py`. The full permission matrix, transition guards, notification and reminder schedules and the audit record are in `docs/02-workflow-and-rbac.md`; the same content is kept in Markdown as `docs/06-approval-flow.md`. Typeset in Barlow as a stand-in for Trade Gothic Next.
